Theorem (Brendle-W., 2015)

(ZFC) No set of reals of size continuum is “ s_0 -shiftable”.

Definition

A set $Y \subseteq 2^\omega$ is **Marczewski null** ($Y \in s_0$) $:\Leftrightarrow$
for any perfect set $P \subseteq 2^\omega$ there is a perfect set $Q \subseteq P$ with $Q \cap Y = \emptyset$.

$$\Leftrightarrow \forall p \in \mathcal{S} \quad \exists q \leq p \quad [q] \cap Y = \emptyset$$

Definition

A set $X \subseteq 2^\omega$ is **s_0 -shiftable** $:\Leftrightarrow \forall Y \in s_0 \quad X + Y \neq 2^\omega$
 $\Leftrightarrow \forall Y \in s_0 \quad \exists t \in 2^\omega \quad (X + t) \cap Y = \emptyset$.

Theorem (Brendle-W., 2015, restated more explicitly)

(ZFC) Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$. Then there is a $Y \in s_0$ with $X + Y = 2^\omega$.

Theorem (Brendle-W., 2015)

(ZFC) No set of reals of size continuum is “ s_0 -shiftable”.

Strong measure zero

For an interval $I \subseteq \mathbb{R}$, let $\lambda(I)$ denote its length.

Definition (well-known)

A set $X \subseteq \mathbb{R}$ is (Lebesgue) **measure zero** if

for each positive real number $\varepsilon > 0$

there is a sequence of intervals $(I_n)_{n < \omega}$ of total length $\sum_{n < \omega} \lambda(I_n) \leq \varepsilon$
such that $X \subseteq \bigcup_{n < \omega} I_n$.

Definition (Borel; 1919)

A set $X \subseteq \mathbb{R}$ is **strong measure zero** if

for each sequence of positive real numbers $(\varepsilon_n)_{n < \omega}$

there is a sequence of intervals $(I_n)_{n < \omega}$ with $\forall n \in \omega \lambda(I_n) \leq \varepsilon_n$

such that $X \subseteq \bigcup_{n < \omega} I_n$.

Consistency of MBC

Theorem (Brendle-W., 2015)

(ZFC) No set of reals of size continuum is “ s_0 -shiftable”.

Corollary

CH implies MBC (i.e., s_0 -shiftables = $[2^\omega]^{\leq \aleph_0}$).

So what about larger continuum?

Theorem (Brendle-W., 2015)

In the Cohen model, MBC holds.

Consistency of MBC

Theorem (Brendle-W., 2015)

(ZFC) No set of reals of size continuum is “ s_0 -shiftable”.

Theorem (Brendle-W., 2015)

In the Cohen model, MBC holds.

Properties of s_0

Proposition

Let $Y \subseteq 2^\omega$ with $|Y| < \mathfrak{c}$. Then $Y \in s_0$.

Why? Perfect sets can be split into “perfectly many” disjoint perfect sets.

Theorem

There is a set $Y \in s_0$ with $|Y| = \mathfrak{c}$.

Sketch of proof.

- Fix a maximal antichain $\{q_\alpha : \alpha < \mathfrak{c}\} \subseteq \mathbb{S}$ in Sacks forcing.
- In particular, $||[q_\alpha] \cap [q_\beta]|| \leq \aleph_0$ for any $\alpha \neq \beta$.
- So (for each $\alpha < \mathfrak{c}$) we can pick $y_\alpha \in [q_\alpha] \setminus \bigcup_{\beta < \alpha} [q_\beta]$.
- By maximality of the antichain, and the proposition above, $Y := \{y_\alpha : \alpha < \mathfrak{c}\}$ is as desired. □

Properties of s_0

Lemma

Let $X \subseteq 2^\omega$, and let $D \subseteq \mathbb{S}$ be a **dense** and **translation-invariant** set of Sacks trees with the property that any **less than \mathfrak{c}** many (of its bodies) do **not cover** X .

Then there is a $Y \in s_0$ such that $X + Y = 2^\omega$ (i.e., X is **not** s_0 -shiftable).

Sketch of proof.

- Fix a maximal antichain $\{q_\alpha : \alpha < \mathfrak{c}\} \subseteq D$ (within the **dense** set D).
- Fix an enumeration $2^\omega = \{z_\alpha : \alpha < \mathfrak{c}\}$.
- **By our assumptions**, we can pick $x_\alpha \in X \setminus \bigcup_{\beta < \alpha} (z_\beta + [q_\beta])$.
- Let $y_\alpha := x_\alpha + z_\alpha$. And let $Y := \{y_\alpha : \alpha < \mathfrak{c}\}$.
- Then
 - ▶ $X + Y = 2^\omega$, and
 - ▶ $Y \in s_0$.

Lemma

$$Y \text{ is } \dots \iff \forall p \in \mathbb{S} \quad \exists q \leq p \quad \forall t \in 2^\omega \quad |([q] + t) \cap Y| < \mathfrak{c}$$

Definition

A set $Y \subseteq 2^\omega$ is **$<\kappa$ -transitively Marczewski null** (**$<\kappa$ -trans- s_0**)

$$\iff \forall p \in \mathbb{S} \quad \exists q \leq p \quad \forall t \in 2^\omega \quad |([q] + t) \cap Y| < \kappa.$$

A set $Y \subseteq 2^\omega$ is **$\leq\kappa$ -transitively Marczewski null** (**$\leq\kappa$ -trans- s_0**)

$$\iff \forall p \in \mathbb{S} \quad \exists q \leq p \quad \forall t \in 2^\omega \quad |([q] + t) \cap Y| \leq \kappa.$$

Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ and $X' \in \mathfrak{s}_0$.

Recall the notion of Luzin set (we could say: \mathcal{M} -Luzin set):

X is (generalized) Luzin if

($|X| = \mathfrak{c}$ and) its intersection with any meager set is of size less than \mathfrak{c} .

So the above lemma says:

There are no “ \mathfrak{s}_0 -Luzin sets” (in ZFC).

Proof.

- 1st case: $X \in \mathfrak{s}_0$, and we are finished :-)
- 2nd case: $X \notin \mathfrak{s}_0$, then we can fix $p \in \mathbb{S}$ with: $\forall q \leq p \quad |[q] \cap X| = \mathfrak{c}$.
Construct a \mathfrak{c} -sized set $X' \in \mathfrak{s}_0$ inside of $[p] \cap X$:
Fix a maximal antichain below p, \dots, \dots , and we are finished :-)

Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ and $X' \in \mathfrak{s}_0$.

Recall the notion of Luzin set (we could say: \mathcal{M} -Luzin set):

X is (generalized) Luzin if

($|X| = \mathfrak{c}$ and) its intersection with any meager set is of size less than \mathfrak{c} .

So the above lemma says:

There are no " \mathfrak{s}_0 -Luzin sets" (in ZFC).

Proof.

- 1st case: $X \in \mathfrak{s}_0$, and we are finished :-)
- 2nd case: $X \notin \mathfrak{s}_0$, then we can fix $p \in \mathbb{S}$ with: $\forall q \leq p \quad |[q] \cap X| = \mathfrak{c}$.
Construct a \mathfrak{c} -sized set $X' \in \mathfrak{s}_0$ inside of $[p] \cap X$:
Fix a maximal antichain below p, \dots, \dots , and we are finished :-)

Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ and $X' \in \mathfrak{s}_0$.

Recall the notion of Luzin set (we could say: \mathcal{M} -Luzin set):

X is (generalized) Luzin if

($|X| = \mathfrak{c}$ and) its intersection with any meager set is of size less than \mathfrak{c} .

So the above lemma says:

There are no " \mathfrak{s}_0 -Luzin sets" (in ZFC).

Proof.

Lemma (from previous slide)

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ and $X' \in s_0$.

Main Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ such that X' is $<\mathfrak{c}$ -trans- s_0 .

Outline of the proof:

- W.l.o.g. $X \in s_0$ (by the lemma above).

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ such that X' is $<\mathfrak{c}$ -trans- s_0 .

- W.l.o.g. $X \in s_0$ (by the lemma above).
- $p \in \mathbb{S}$ is *skew* if there is at most one splitting node on each level.
- We distinguish two cases:
- **1st Case:** For each skew $p \in \mathbb{S}$: $|[p] \cap X| < \mathfrak{c}$.
 - ▶ The collection of skew trees is dense and translation-invariant.
 - ▶ Hence, X is $<\mathfrak{c}$ -trans- s_0 , i.e., $\forall q \in \mathbb{S} \exists r \leq q \forall t \in 2^\omega |([r] + t) \cap X| < \mathfrak{c}$.
- **2nd Case:** Fix a skew tree $p \in \mathbb{S}$ with $|[p] \cap X| = \mathfrak{c}$.
 - ▶ Define $X' := [p] \cap X$. (So $|X'| = \mathfrak{c}$.)
 - ▶ Then X' is $<\mathfrak{c}$ -trans- s_0 (actually even X' is $\leq \aleph_0$ -trans- s_0). Why?
 - ▶ Since p is skew, $t \neq 0 \Rightarrow |[p] \cap [p + t]| \leq 2$.
 - ▶ Therefore, $\{p + t : t \in 2^\omega\}$ is an antichain in \mathbb{S} .
 - ▶ Given $q \in \mathbb{S}$, we now use $X' \in s_0$ to find $r \leq q$, and finish the proof :-))

Main Lemma

 - ▶ Hence, X is $<\mathfrak{c}$ -trans- s_0 , i.e., $\forall q \in \mathbb{S} \exists r \leq q \forall t \in 2^\omega |([r] + t) \cap X| < \mathfrak{c}$.
 - **2nd Case:** Fix a **skew** tree $p \in \mathbb{S}$ with $|[p] \cap X| = \mathfrak{c}$.
 - ▶ Define $X' := [p] \cap X$. (So $|X'| = \mathfrak{c}$.)
 - ▶ Then X' is $<\mathfrak{c}$ -trans- s_0 (actually even X' is $\leq \aleph_0$ -trans- s_0). Why?
 - ▶ Since p is skew, $t \neq 0 \Rightarrow |[p] \cap [p + t]| \leq 2$.
 - ▶ Therefore, $\{p + t : t \in 2^\omega\}$ is an antichain in \mathbb{S} .
 - ▶ Given $q \in \mathbb{S}$, we now use $X' \in s_0$ to find $r \leq q$, and finish the proof :-))

Main Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ such that X' is $<\mathfrak{c}$ -trans- s_0 .

$$\forall q \in \mathbb{S} \exists r \leq q \forall t \in 2^\omega (|[r] + t] \cap X'| < \mathfrak{c}).$$

Lemma

Let $X \subseteq 2^\omega$, and let $D \subseteq \mathbb{S}$ be a **dense** and **translation-invariant** set of Sacks trees with the property that any **less than \mathfrak{c}** many (of its bodies) do **not cover** X .

Then there is a $Y \in s_0$ such that $X + Y = 2^\omega$ (i.e., X is **not** s_0 -shiftable).

(ZFC) Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$. Then there is a $Y \in s_0$ with $X + Y = 2^\omega$.

Main Lemma (more complicated, but not stronger!)

Assume **\mathfrak{c} is singular**. Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there is $X' \subseteq X$ with $|X'| = \mathfrak{c}$ and $\mu < \mathfrak{c}$ such that X' is $\leq \mu$ -trans- s_0 .

Main Lemma

Let $X \subseteq 2^\omega$ with $|X| = \mathfrak{c}$.

Then there exists an $X' \subseteq X$ with $|X'| = \mathfrak{c}$ such that X' is $<\mathfrak{c}$ -trans- s_0 .

$$\forall q \in \mathbb{S} \exists r \leq q \forall t \in 2^\omega (|[r] + t] \cap X'| < \mathfrak{c}.$$

Skew perfect sets in an arbitrary (?) Polish group G

Definition

$Z \subseteq G$ is **skew** if for all $x, y, z, w \in Z$ with $x \neq y$, $z \neq w$, and $\{x, y\} \neq \{z, w\}$, we have $x - y \neq z - w$.

Proposition

Assume $Z \subseteq G$ is **skew** and $t \in G$ with $t \neq 0$. Then $|Z \cap (Z + t)| \leq 2$.

Proposition

Being skew is **translation-invariant**.

Lemma

The skew perfect sets are **dense** in the perfect sets, i.e., for each perfect set $P \subseteq G$ there is a skew perfect set $Q \subseteq P$.
